As multiple sclerosis develops, the protective layer around a person's nerve fibers is destroyed, preventing signals from getting transmitted between the brain and the rest of the body. That lack of communication leads to a loss of function, such as motor issues and muscle weakness.

## Multiple Sclerosis Symptoms Research 2017: Why Do Some MS ...

Multiple sclerosis (MS) is an inflammatory auto-immune disease of the central nervous system (CNS). Serum glucose alterations and impaired glucose tolerance (IGT) are reported in MS patients, and are commonly associated with the development of cardio-metabolic co-morbidities. We previously found that a subgroup [...]

P. Bannerman, in *The Cerebral Cortex in Neurodegenerative and Neuropsychiatric Disorders*, 2017. Introduction. Multiple sclerosis (MS) is a chronic neuroinflammatory disease of the brain and spinal cord causing demyelination and multiple forms of neuronal damage and, as such, should be classified as a neurodegenerative disease (Bar-Or, Rieckmann, Traboulsee, & Yong, 2011).
