This recurring theme of mirrors and kaleidoscopes makes finite reflection groups real and concrete. The focus is decidedly on the geometric intuition. Readers do not need to know much group theory, though some group-theoretic concepts and results are used every now and then.

Hence, with any its two points a and b , a half space contains the segment $[a;b]$. Subsets in AR^n with this property are called convex. More generally, a curve is an image of the segment $[0;1]$ of the real line R under a continuous map from $[0;1]$ to AR^n . In particular, a segment $[a;b]$ is a curve, the map being $t \mapsto a+tb$.

object or two-dimensional figure is the virtual image formed by reflection in a plane mirror; it is of the same size as the original object, yet different, unless the object or figure has reflection symmetry (also known as a P-symmetry). Two-dimensional mirror images can be seen in the reflections of mirrors or other reflecting surfaces, or on a printed surface seen inside-out.
