Network Scanning

Ndiff is a tool to aid in the comparison of Nmap scans. It takes two Nmap XML output files and prints the differences between them. The differences observed are:

- Host states (e.g. up to down)

To get started. This is a
simple command for
scanning your local
network (class C or /24):
`nmap -sV -p 1-65535`

Where To Download

192.168.1.1/24. This command will scan all of your local IP range (assuming your in the 192.168.1.0-254 range), and will perform service identification -sV and will scan all ports -p 1-65535.

Nmap Tutorial: from the Basics to Advanced Tips
On average Nmap sends 5-10 fewer packets per

Where To Download

host, depending on network conditions. If a single subnet is being scanned (i.e.

192.168.0.0/24) Nmap may only have to send two packets to most hosts. -n (no DNS resolution) Tells Nmap to never do reverse DNS resolution on the active IP addresses it finds.

Since DNS can be slow even with Nmap 's built-

Where To Download

in parallel stub resolver,
this option can slash
scanning times.

Databases, Systems &
Networks » Nmap
Reference Guide

Reading the nmap
reference guide, I can see
why I made this
assumption:-sn (No port
scan) This option tells
Nmap not to do a port
scan after host discovery,

Where To Download

and only print out the available hosts that responded to the host discovery probes.
